BAD protein;

```
CC The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell CC death regulator) proteins, having an amino acid other than Ser at CC position 112 and/or 136, relative to the murine BAD 204 as sequence. The CC position 121 and/or 136, relative to the murine BAD 204 as sequence. The CC forgments of mutant BAD protein able to decrease cell viability; (2) CC fusion proteins of mutant BAD protein BAD proteins are used to treat CC increases intracellular delivery. Mutant BAD proteins are used to treat CC increases intracellular delivery. Mutant BAD proteins are used to treat CC viral infection, lymphoproliferation, arthritis, infertility. Concer, CC viral infection, lymphoproliferation, arthritis, infertility. Infertility inflammation and autoimmune disease. Polynucleotide sequences encoding CC untrant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD CC proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful CC in treatment of excessive apoptosis such as AIDS, neurodegeneration, CC aging or ischaemic cell death. The apoptosis such as AIDS, neurodegeneration, CC determined by measuring relative amounts of phosphorylated and non-cc phosphorylated BAD, by usual immunoassays. Mutant BAD proteins have CC phosphorylated on the specified Ser, forming a product that does not construct death-promoting activity than wild-type BAD which can become CC phosphorylated cannot bind 14-3-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New mutant BAD polypeptide with phosphorylatable serine replaced useful for, e.g. treating reduced apoptosis such as in cancer or viral infection {\bf r}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  serine substituted mutant; apoptosis; cancer; viral infection

The CC present sequence represents a mutant BAD protein. Also described are: (1) CC frayments of mutant BAD with a heterologous polypeptide that increases intracellular delivery, Mutant BAD proteins are used to treat cor prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, (2) inflammation and autoimmune disease. Polypucleotide sequences encoding curiangenic animals for use as disease models or in drug screening. BAD curiant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD curiant BAD proteins phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, caping or ischaemic cell death. The apoptotic status of cells is aging or ischaemic cell death. The apoptotic status of cells is caping or ischaemic cell death. The apoptotic status of cells is caping or ischaemic cell death. The apoptotic status of cells is caping or ischaemic cell death. The apoptotic that proteins have companied by measuring relative amounts of phosphorylated and non-cell death and the specified Ser, forming a product that does not become companied by measuring relative than which that does not beterodimerise with BCL-2 or BCL-XL but instead binds to 14-3-3 family companied by measuring activity than which to the specified ser substituted cannot bind 14-3-3.
                                                                                                                                                                                                                                                                                                Query Match

This sequence represents a novel serine-phosphorylated protein. BAD (Bcl-X/Bcl-2 associated cell death regulator). The serine residue is phosporylated in a post-translational modification and allows binding to the 14-3-3 protein which is a signal transduction regulator. Modulators of phosphorylated BAD, which act through inhibition/activation of a phosphoserine phosphatase, are useful for preventing/treating increased/decreased apoptosis in a cell. The increased apoptosis may result from immunodeficiency diseases, sensecence, neurodegenerative disease, ischaemic cell death, reperfusion cell death, infertility and wound-healing. Decreased apoptosis may result from canocer, viral infection, lymphoproliferative conditions, arthritis, infertility, hosphorylated compared to unphosphorylated BAD polypeptide and/or total phosphorylated compared to unphosphorylated BAD polypeptide and/or total BAD in a cell is useful for determining the apoptotic state of a cell.
                                                                                                                                                                                                                                                                                                                                                                                   Serine-phosphorylated Bel-X-1/Bel-2 Associated cell Death regulator polypeptide - useful for modulation of apoptosis associated with, e.g. cancer and immunodeficiency diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    09-SEP-1997;

The present invention describes an isolated or synthetic polypeptide (I) comprising a less than fill length amino acid sequence of a mutant CC Sci-XL/Rcl-2 associated cell death regulator polypeptide (BAD) or its CC fragment, which contains amino acid substitutions at Serill of a human CC BAD, Seril5 of a murine BAD (1) proper murine BAD) or Seril3 of a murine BAD (1) proper murine BAD) or Seril3 of a murine BAD (1) proper murine BAD) or Seril3 of a murine BAD (1) proper murine BAD) or Seril3 of a murine BAD (1) proper murine BAD (2) proper murine BAD (3) proper murine BAD (4) proper murine BAD mutant amino acid sequence from the present collaboration on the present sequence represents a specifically invention and cutofiamure diseases. The present sequence represents a specifically control invention and murine BAD mutant amino acid sequence from the present collaboration and subolimine diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match 100.0%; Score 138; DB 22; Best Local Similarity 100.0%; Fred.                                                                                                                                                                                                                                                                                                                                                                                                              The sequence represents the amino acid sequence of Bad-DTTR apoptosis-
cc modifying fusion protein comprising Bad gene sequence fused via a short
cc linker to diphtheria toxin translocation domain (DTTR). The
cc functional apoptosis-modifying fusion protein is capable of binding a
cc target cell and integrating into or crossing a cellular membrane of the
cc target cell and the Bcl-Xi domain, which modifies an apoptotic response
cc target cell and the Bcl-Xi domain, which modifies an apoptotic response
cc target cell and the Bcl-Xi domain, which modifies an apoptotic response
cc inhibiting or enhancing) apoptosis in a target cell, such as neuron,
cc imphocyte, cancer, neoplasm, macrophage, epithelial, stem, tumour or
dyperropiliferative cell or an adipocyte. It is also useful for reducing
cc apoptosis in a subject after translent ischaemic neuronal injury
cc especially spinal cord injury. The fusion protein may be used to treat
cc various diseases and injury conditions through inhibition or enhancement
cc such as Alzebarer's disease, Huntington's disease, spinal muscular
atrophy, stroke episodes and unregulated cell growth as in tumours and
cc various cancers. The apoptosis modifying fusion protein can be delivered
cc effectively throughout the body and targeted to selective tissue and

                                                                                                                                                                                                                     The present sequence represents a protein of 166 amino acids. The sequence is disclosed as being a protein called BBC6 which regulates cell death through interaction with BC1-2. The DNA may be used for the production of the recombinant protein, which can be used in unspecified therapeutic or diagnostic procedures, as a molecular weight marker, and to raise antibodies that can be used in unspecified diagnostic or therapeutic applications and to reduce or eliminate the biological activity of the BBC6 protein in vivo.

threbline synthase (EC 4.2.99.2) precursor - Arabidopsis thaliana N. N. Alternate names: protein F27813.80
N. Alternate names: protein F27813.80
C. Species: Arabidopsis thaliana (mouse-ear cress)
C. Species: Alloun-1999 #sequence_revision 11-Jun-1999 #text_change 07-Dec-1999
C. Accession: T08545; S71356; S71357
R. Bevan, M.; Zimmermann, W.; Gruenetsen, A.; Wambutt, R.; Bancroft, I.; Mewes, i submitted to the Protein Sequence Database, May 1999
A; Reference number: Z16442
A; Accession: T08545
A; Molecule type: DNA
A; Residues: 1-526 <ABV

RT their interaction with Bc1 w in sympathetic neurons.";

RL Mol. Cell. Neurosci. 17:97-106(2001)

C-1 FUNCTION: Promotes cell death. Successfully competes for the 10 february of the services of heterodimerization of these proteins with BAX. Can reverse the 10 death repressor activity of Bc1-x(L), but not that of Bc1-2 (By 10 february). Appears to act as a link between growth factor receptor signaling and the apoptotic pathways.

C-1 SUBUNIT: Forms heterodimers with the anti-apoptotic proteins, Bc1-12 (Subunitarity). Appears to act as a link between growth factor 113/Ser-137 phosphorylated form binds protein $100AlO. The Ser-137 yhosphorylated form binds protein $100AlO. The Ser-113/Ser-137 phosphorylated form binds 14-3-3 proteins.

C-1 SUBCELIULAR LOCATION: Outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm (By similarity). Alternative splicing. They differ only in their C-produced by alternative splicing. They differ only in their C-terminal regions.

1 Interest processed in all tissues tested, including brain, liver, spleen and heart. In the brain, restricted to epithelial cells of the choroid plexus. Isoform alpha is the more

PTM: Phosphorylated on Ser-13 in response to survival stimuli. Subsequent phosphorylation on Ser-137 promotes heterodimerization with 14-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-156, a site within the BH3 domain, leading to the release of BC1-x(L) and the promotion of cell survival. Ser-137 is the major site of AKT/PKB phosphorylation, Ser-156 the major site of protein kinase A (CAPK) phosphorylation (By

*Rationale for Bcl-xL/Bad peptide complex formation from structure, mutagenesis, and biophysical studies.*;

*Protein Sci. 9:2528-2534(2000).

-!- FUNCTION: Promotes cell death. Successfully competes for the binding to Bcl-x(L), Bcl-2 and Bcl-v. thereby affecting the level of heterodimerization of these proteins with BAX. Can reverse the death repressor activity of Bcl-x(L), but not that of Bcl-2 (By similarity). Appears to act as a link between growth factor receptor signaling and the apoptotic pathways.

-!- SUBUNIT: Forms heterodimers with the anti-apoptotic proteins, Bcl-x(L), Bcl-2 and Bcl-w. Also binds protein S100A10 (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      HUMAN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       01-NOV-1997 (Rel. 35, Created)

SIMILARITY: CONTAINS 1 BCL-3 HOMOLOGY DOMAIN 3 (BH3).
SIMILARITY: BELONGS TO THE BCL-2 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 subsequent phosphorylation on Ser-99 promotes heterodimerization with 14-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-118, a sitte within the BH3 domain, leading to the release of BCl-\mathbf{x}(\mathbf{L}) and the promotion of cell survival. Ser-99 is the major site of AKT/PKB phosphorylation, Ser-118 the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PTM: Phosphorylated on Ser-75 in response to survival stimuli. Subsequent phosphorylation on Ser-99 promotes heterodimerization

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                    Score
